

PART 611-8: ISSUES FOR FUTURE STUDY

State transportation planning issues for further study or policy development are as follows:

- future financing, especially the match for federally funded projects and sources of revenue for 100 percent state-funded projects;
- a funded program for local pavement management;
- bringing about land use patterns that support transportation policy, especially the reduction of auto travel and encouragement of alternative modes;
- development and adoption of performance objectives and measures for the state transportation system;
- developing a methodology for identifying major travel corridors within the state and a multi-disciplinary, multi-jurisdictional planning process for assessing and addressing travel needs within a travel corridor framework;
- fixed-route and paratransit service policy, especially as travel needs increase among elderly, disabled, low-income, and transit-dependent populations;
- further development of statewide travel modeling, including integration of transit and other alternative modes, and consideration of alternative land use patterns and resulting impacts on transportation and air quality; and
- other specific areas identified in recommendations of this plan.
